allEqual	<i>Are All Values Equal to the First?</i>
----------	---

Description

A short-cut function for `all (x==x[1])`, which asks are all values in *x* equal to the first value in *x*.

Usage

`allEqual(x)`

Arguments

x vector of values.

Value

TRUE or FALSE

See Also

[all](#), [clearAll](#), [clipVector](#)

calc.projExpect	<i>Calculate Expectations and Probabilities</i>
-----------------	---

Description

Calculate the expectation of projection to reference, and probability of being greater than reference.

Usage

```
calc.projExpect ( obj, projObj, refYrs )
calc.projExpect2( obj, projObj, refList )
calc.projProbs  ( obj, projObj, refYrs )
calc.projProbs2 ( obj, projObj, refList )
calc.refProbs   ( projObj=currentProj$B, refPlist=refPointsList )
```

Arguments

obj	matrix of biomass MCMCs.
projObj	matrix of biomass projections.
refYrs	numeric vector of reference years
refList	list of reference years (numeric vectors).
refPlist	list of reference points.

Details

```
calc.projExpect... Calculate the expectation of projection to reference.
..... Compare reference years to projection years.
calc.projExpect2... Calculate expectation (projection biomass / reference biomass).
calc.projProbs... Calculate the probability of being greater than refYrs.
..... Compare reference years to projection years.
calc.projProbs2... Calculate the probability of being greater than refYrs.
..... Compare reference years to projection years.
calc.refProbs... Calculate the reference probabilities (based on calc.projProbs2).
```

Value

Decision tables

Author(s)

Andrew Edwards, Pacific Biological Station, Fisheries and Oceans Canada, Nanaimo BC

See Also

[calc.refVal](#)

calc.refVal	<i>Calculate Reference Value for Performance Measure</i>
-------------	--

Description

Calculate the reference value for performance measures.

Usage

```
calc.refVal(obj, refYrs, fun=mean)
```

Arguments

obj	scape Biomass matrix with n rows and m columns, where n = number of MCMC samples, and m = number of years.
refYrs	numeric years in reference period.
fun	the function to apply to reference period i .

Value

Returns a vector of length `nrow(obj)` reference values.

Author(s)

Andrew Edwards, Pacific Biological Station, Fisheries and Oceans Canada, Nanaimo BC

See Also

[calc.projExpect](#), [findTarget](#)

close.allWin	<i>Close All Open Devices</i>
--------------	-------------------------------

Description

Close all open devices.

Usage

```
close.allWin()
```

See Also

[closeWin](#)

`cquantile`*Running Quantile*

Description

Creates a set of running quantiles from MCMC traces.
(Uses subfunction found in **coda**'s function `cumuplot`.)

Usage

```
cquantile(z, probs)
cquantile.vec(z, prob)
```

Arguments

<code>z</code>	an MCMC object.
<code>probs</code>	vector of quantiles.
<code>prob</code>	single quantile.

Value

```
cquantile.....running quantile matrix
cquantile.vec...running quantile vector
```

Note

Arni Magnusson describes a running quantile as:
“the evolution of the sample quantiles as a function of the number of iterations”

Author(s)

Andrew Edwards, Pacific Biological Station, Fisheries and Oceans Canada, Nanaimo BC

See Also

[cumuplot](#), [plotTracePOP](#)

findTarget

*Find Time to Achieve a Target Reference Point***Description**

Find the time (years) to achieve a recovery target (including a moving target) with a given confidence. Produce decision tables showing the probability of exceeding the reference point.

Usage

```
findTarget(Vmat, yrU=as.numeric(dimnames(Vmat)[[2]]), yrG=90,
           ratio=0.5, target=B0.MCMC, conf=0.95, plotit=FALSE, retVal="N")
```

Arguments

Vmat	matrix of projected biomass values B_{Nt} , where N = number of MCMCs and t = projection year.
yrU	user-specified projection years.
yrG	number of years G for a moving target window (e.g., 3 YMR generations = 90y); might not work for all possibilities.
ratio	recovery target ratio R .
target	recovery target values T_N = B_0 .MCMC for ratios of B_0 ; = B_{msy} .MCMC for ratios of B_{MSY} ; = B_t .MCMC for moving window of $B_{N,t-G}$.
conf	confidence level C required.
plotit	logical: if TRUE, plot the probability p_t of exceeding target reference point.
retVal	character name of object to return: retVal="N" : creates global object "Ttab" (see below); retVal="p.hi" : creates global object "Ptab" (see below).

Details

As this function uses Bayesian output, there are N (e.g., 1000) values of some target T_N , which can remain fixed (B_0 , B_{MSY}) or move forward in time G years before the projection year t (that is $T_{N,t-G}$). For simplification, we'll just call all targets T_N .

The probability of exceeding a target ratio R is:

$$p_t = \frac{1}{N} \sum^N \left[\frac{B_{Nt}}{T_N} \geq R \right],$$

where R = target ratio of the reference point (e.g., $0.4B_{MSY}$ ($R=0.4$), $0.2B_0$ ($R=0.2$), $0.5B_{t-G}$ ($R=0.5$)).

At a glance, we can see for any given projection year t whether the probability of achieving a target ratio is greater than the confidence required:

$$p_t \geq C,$$

where C is the confidence level acceptable.

Value

If `retVal="N"` then the function returns a data frame object called "`Ttab`" in the user's global environment. This table reports the number of years to achieve the target reference point at various catch levels with a specified confidence.

If `retVal="p.hi"` then the function returns a list object called "`Ptab`" in the user's global environment. This list contains data frames (tables) that report the probability of achieving various reference points at specified catch levels.

Any other `retVal` will return a list of the specified object, if it exists in the function.

Author(s)

Rowan Haigh, Pacific Biological Station, Fisheries and Oceans Canada, Nanaimo BC

[runSweaveMCMC](#)

<code>get.resFile</code>	<i>Get Awatea Results Files for Menu</i>
--------------------------	--

Description

A function that retrieves the names of Awatea results files (`.res$`) for use in the `mainMenu` command. When choice is made, the function loads the results file and assigns it to the global environment as `currentRes`.

Usage

```
get.resFile(resFile=NULL)
```

Arguments

<code>resFile</code>	supposedly the name of a results file, but the code suggests that argument is ignored.
----------------------	--

Value

A results file chosen from a menu.

Note

AME: made changes so that options are compatible with those in `load.allResFiles`. Previously, trouble occurred when overwriting.

See Also

[mainMenu](#), [importCol2](#)

`getYrIdx`*Select a Subset of Years for Plotting*

Description

Select a subset of years for which many years are available. The default is to select 5-year increments.

Usage

```
getYrIdx(yrNames, mod=5)
```

Arguments

<code>yrNames</code>	vector (character or numeric) of years.
<code>mod</code>	select the years modulo <code>mod</code> .

Value

Subset of input years that are modulo `mod`.

Author(s)

Andrew Edwards, Pacific Biological Station, Fisheries and Oceans Canada, Nanaimo BC

graphics

Open a Windows Device

Description

Open a windows device in portrait or landscape mode.

Usage

```
graphics(view = "portrait")
```

Arguments

view	if "portrait", set width = 8.5 in and height = 11 in if "landscape", set width = 11 in and height = 8.5 in
------	---

[resetGraph](#)

importCol2

Import Coleraine Model Results (AME version)

Description

Import Coleraine model results from .res file, and rearrange into a standard format suitable for plotting.

Usage

```
importCol2(res.file, info="", Dev=FALSE, CPUE=FALSE, Survey=FALSE,
  CAC=FALSE, CAs=FALSE, CLc=FALSE, CLs=FALSE, LA=FALSE,
  quiet=TRUE, extra=TRUE)
```

Arguments

res.file	name of Coleraine model results file to import.
info	optional string containing information to store with model results.
Dev	logical: whether recruitment deviates were estimated in model.
CPUE	logical: whether model was fitted to catch-per-unit-effort data.
Survey	logical: whether model was fitted to survey abundance index data.
CAC	logical: whether model was fitted to commercial catch-at-age data.
CAs	logical: whether model was fitted to survey catch-at-age data.
CLc	logical: whether model was fitted to commercial catch-at-length data.

CLs	logical: whether model was fitted to survey catch-at-length data.
LA	logical: whether model was fitted to length-at-age data.
quiet	logical: whether to report progress while parsing file.
extra	logical: if TRUE, import likelihoods, parameters, priors, and recruitment residuals.

Details

This function was modified from the original `importCol` function in the **scape** package to grab extra data.

Value

A list of class `scape` containing at least `N`, `B`, and `Sel`. The other elements may or may not be included in the list, depending on how `importRes` was called:

<code>N</code>	predicted numbers at age
<code>B</code>	predicted biomass, recruitment, and observed landings (year things)
<code>Sel</code>	predicted selectivity and observed maturity (age things)
<code>Dev</code>	predicted recruitment deviates from the stock-recruitment curve
<code>CPUE</code> , <code>Survey</code>	commercial and survey abundance index and fit
<code>CAC</code> , <code>CAs</code>	commercial and survey C@A (catch at age) and fit
<code>CLC</code> , <code>CLs</code>	commercial and survey C@L (catch at length) and fit
<code>LA</code>	observed L@A and fit

Note

This import function is implemented for the Coleraine statistical catch-at-age software, and can serve as a template for **scape** users who would like to implement import functions for specific stock assessment software.

The functions `ll` (package **gdata**) and `head` are recommended for browsing model results, e.g. `ll(x.cod)`; `ll(x.cod$N)`; `head(x.cod$N)`.

References

`importRes`, `read.table`, `readLines`, and `scan` to import any data.
[scape-package](#) gives an overview of the package **scape**.

importMCMC.ddiff	<i>Import Functions for PJS Delay Difference Model</i>
------------------	--

Description

Make a **scapeMCMC** object identical in format to the result of `importMCMC` (or `importProj`) from PJS delay difference model output.

The difference is that *B* is biomass defined by a delay difference model.

Usage

```
importMCMC.ddiff()  
importProj.ddiff()
```

Value

`importMCMC.ddiff` returns a list object containing:

- L . . . likelihood MCMCs,
- P . . . parameter MCMCs,
- B . . . spawning biomass MCMCs,
- R . . . recruitment MCMCs.

`importProj.ddiff` returns a list object containing:

- B . . . projected biomass,
- Y . . . projected yields.

Note

Get the biomass projection – PJS does 1 year ahead projection. The column "X" appears as the last column because trailing ", " exist in the `mcmcpjbiom.csv` file.

Note also that "cat=" in .csv file becomes "cat." in `read.table`.

Author(s)

Andrew Edwards, Pacific Biological Station, Fisheries and Oceans Canada, Nanaimo BC

See Also

[importMCMC](#), [importProj](#), [read.table](#)

importProjRec	<i>Import Projected Recruitment</i>
---------------	-------------------------------------

Description

Import the projected recruitments (actually, the values are random normals $N(0, 1)$).

Usage

```
importProjRec(dir, info="", coda=FALSE, quiet=TRUE)
```

Arguments

dir	directory where MCMC projections reside.
info	user-supplied information, if desired.
coda	logical: if TRUE, use the function <code>mcmc</code> in the package coda to generate MCMCs.
quiet	logical: if TRUE, print progress messages to the R console.

Details

The values saved by the Awatea code are random normals $N(0, 1)$, which for a particular MCMC sample are the same for all the catch strategies.

Value

A list object comprising:

B	data frame of spawning biomass (dim = MCMC samples by projected years)
Y	data frame of yield (dim = MCMC samples by projected years)
eps	data frame of ϵ_t (dim = MCMC samples by projected years)

Note

The function `importProj` does not import recruitment residuals.

This function grabs the `tempdev` values from Awatea, which are just $N(0, 1)$ values, then multiplies them by σ_R to yield $\epsilon_t \sim N(0, \sigma_R^2)$.

The parameter value for σ_R can be found in `currentRes$extra$residuals$p_log_RecDev[6]`.

Author(s)

Andrew Edwards, Pacific Biological Station, Fisheries and Oceans Canada, Nanaimo BC

See Also

[importProj](#)
coda: [mcmc](#)

importRes

*Import Coleraine Model Results (RH version)***Description**

Import Coleraine model results from `.res` file, and rearrange into a standard format suitable for plotting.

Usage

```
importRes(res.file, info="", Dev=FALSE, CPUE=FALSE, Survey=FALSE,
          CAC=FALSE, CAS=FALSE, CLc=FALSE, CLs=FALSE, LA=FALSE, quiet=TRUE,
          extra=TRUE, sep=" ")
```

Arguments

<code>res.file</code>	name of Coleraine model results file to import.
<code>info</code>	optional string containing information to store with model results.
<code>Dev</code>	logical: whether recruitment deviates were estimated in model.
<code>CPUE</code>	logical: whether model was fitted to catch-per-unit-effort data.
<code>Survey</code>	logical: whether model was fitted to survey abundance index data.
<code>CAC</code>	logical: whether model was fitted to commercial catch-at-age data.
<code>CAS</code>	logical: whether model was fitted to survey catch-at-age data.
<code>CLc</code>	logical: whether model was fitted to commercial catch-at-length data.
<code>CLs</code>	logical: whether model was fitted to survey catch-at-length data.
<code>LA</code>	logical: whether model was fitted to length-at-age data.
<code>quiet</code>	logical: whether to report progress while parsing file.
<code>extra</code>	logical: if <code>TRUE</code> , import likelihoods, parameters, priors, and recruitment residuals.
<code>sep</code>	the field separator character (usually <code>" "</code> or <code>"\t"</code>).

Details

This function was modified from the original `importCol` function in the **scape** package to grab extra data and to deal with anomalous characters in Coleraine results files.

Value

A list of class `list` containing at least `N`, `B`, and `Sel`. The other elements may or may not be included in the list, depending on how `importRes` was called:

<code>N</code>	predicted numbers at age
<code>B</code>	predicted biomass, recruitment, and observed landings (year things)

Sel	predicted selectivity and observed maturity (age things)
Dev	predicted recruitment deviates from the stock-recruitment curve
CPUE, Survey	commercial and survey abundance index and fit
CAC, CAs	commercial and survey C@A (catch at age) and fit
CLc, CLs	commercial and survey C@L (catch at length) and fit
LA	observed L@A and fit

Note

This import function is implemented for the Coleraine statistical catch-at-age software, and can serve as a template for **scape** users who would like to implement import functions for specific stock assessment software.

The functions `ll` (package **gdata**) and `head` are recommended for browsing model results, e.g. `ll(x.cod)`; `ll(x.cod$N)`; `head(x.cod$N)`.

load.allResFiles *Load All Awatea .res Files*

Description

Load all Awatea `.res` files in the working directory into a list object.

Usage

```
load.allResFiles(resList = NULL)
```

Arguments

`resList` AME: sets directory to path above current and sets the pattern to "results.dat\$"; probably deprecated.

Value

List of multiple calls to `importCol2`.

Note

If deprecated, remove from package **PBSawatea**.

Author(s)

Andrew Edwards, Pacific Biological Station, Fisheries and Oceans Canada, Nanaimo BC

See Also

[importCol2](#)

MAfun2

Calculate Mean Age by Year

Description

Calculate mean ages from proportions-at-age (modified from a subfunction in `runADMB`).

Usage

```
MAfun2(padata, brks=NULL)
```

Arguments

<code>padata</code>	proportion-at-age data CAc or CAs from a call to <code>importCol2</code> .
<code>brks</code>	breaks specified as numeric years to split the commercial data up into regimes that may account for index discontinuities (not used).

Details

Mean age function supplied by Chris Francis (2011).

`padata` has fields:

`Series...` series identifier

`Year.....` numeric year

`Age.....` age bin

`Obs.....` observed proportions

`Fit.....` predicted (fitted) proportions

`SS.....` sample size (effective N)

Value

List object of observed and expected mean ages, variance of expected ages, and a few bits and bobs.

Author(s)

Rowan Haigh, Pacific Biological Station, Fisheries and Oceans Canada, Nanaimo BC.

References

mainMenu

Create a Menu of Options and Actions

Description

From a main menu, the user can choose various options and actions.

We tend to do everything from the command line so the menu functionality fosters the warning: *CAVEAT EMPTOR*.

Usage

```
mainMenu()  
loadMenu()  
mpdMenu()  
mcmcMenu()  
utilMenu()
```

Details

Main menu items:

```
Import files  
MPD plots  
Plot all MPD graphs  
Save all MPD plots to PNG  
MCMC plots  
Plot all MCMC plots  
Save all MCMC plots to PNG  
Close all graphics windows  
Help & Utilities
```

Load menu items:

```
Get Awatea res file  
Get Awatea MCMC file  
Get Awatea projection file  
Load all res files in working directory  
Get PJS Delay Difference MCMC+Projection
```

MPD menu items:

```
Plot biomass, recruitment, catch  
Plot numbers at age
```

Plot selectivity and maturity
 Plot commercial catch-at-age results
 Plot survey catch-at-age results
 Plot survey catch-at-length results
 Plot abundance index
 All residual plots
 Plot multi-panel biomass, recruitment, catch
 Plot multi-panel exploitation rate
 Plot alternative numbers at age

MCMC menu items:

Plot biomass and projections by policy
 Probability of projection biomass > reference
 Expectation of projection biomass / reference
 Plot biomass posterior densities (plotDens)
 Plot recruitment posterior densities (plotDens)
 Plot parameter posterior densities (plotDens)
 Plot cumulative quantiles (plotCumu)
 Plot traces (plotTrace)
 Plot PJS traces (plt.allTraces)

Utils menu items:

scape Help
 scapeMCMC Help

makeErrMat

Make Ageing Error Matrix for Awatea

Description

Make a simple ageing error matrix for Awatea.

Usage

```
makeErrMat(N=60, ondiag=0.8, offdiag=0.1, corner=0.9)
```

Arguments

N	numeric scalar indicating number of age classes, which determines the dimension of the matrix.
ondiag	numeric value to appear along the matrix diagonal.
offdiag	numeric value to appear one cell to the left and right of the matrix diagonal.
corner	numeric value to appear in the top left and bottom right corners of the matrix.

Value

Simple symmetric ageing error matrix.

Author(s)

Rowan Haigh, Pacific Biological Station, Fisheries and Oceans Canada, Nanaimo BC

See Also

[plotProp](#), [weightBio](#)

msyCalc

Calculate the Maximum Sustainable Yield

Description

Load in `MSY.out` and calculate the MSY (maximum sustainable yield).

Usage

```
msyCalc(dir = getwd(), error.rep = 1)
```

Arguments

`dir` working directory.
`error.rep` numeric: if 1, report errors (reaching bounds), if 0 do not.

Value

Returns a list object containing:
`yield...` maximum sustainable yield,
`u.....` exploitation rate at MSY,
`VB.....` vulnerable biomass at MSY,
`B.....` spawning biomass at MSY,
`nProj...` number of projections needed to reach MSY.

Note

See `msyTestCreating.r` for full details when figuring this out.

out.pmTables	<i>Write Decision Tables to Comma-Delimited Files</i>
--------------	---

Description

Write decision tables to comma-delimited text files (.csv).

Usage

```
out.pmTables(obj, fileName="pm", dec=3)
```

Arguments

obj	list object containing tables (matrices or data frames).
fileName	prefix for output file names.
dec	number of decimal places to retain.

Value

Comma-delimited text files (.csv).

Author(s)

Andrew Edwards, Pacific Biological Station, Fisheries and Oceans Canada, Nanaimo BC

panLab	<i>Write Text to Figure in Relative (0:1) Coordinates</i>
--------	---

Description

Write text to a figure by first setting the coordinate space to lie between 0 and 1:
`par(usr=c(0,1,0,1)).`

Usage

```
panLab(x, y, txt, ...)
```

Arguments

x	relative x-coordinate.
y	relative y-coordinate.
txt	text to add to figure.
...	additional arguments sent to function <code>text</code> .

Note

Currently, this function does not reset the coordinate space to the original.
Use [addLabel](#) instead.

See Also

[addLabel](#), [addLegend](#)

panLegend

Place a Legend in a Figure using Relative (0:1) Coordinates

Description

Place a legend in a figure by first setting the coordinate space to lie between 0 and 1:
`par(usr=c(0,1,0,1))`.

Usage

```
panLegend(x, y, legTxt, ...)
```

Arguments

x	relative x-coordinate.
y	relative y-coordinate.
legTxt	legend text to add to figure.
...	additional arguments sent to function legend.

Note

Currently, this function does not reset the coordinate space to the original.
Use [addLegend](#) instead.

See Also

[addLabel](#), [addLegend](#)

Description

PBSawatea contains the code used for the modelling of populations of Pacific Ocean Perach (*Sebastes alutus*) and Yellowmouth Rockfish (*S. reedi*) along the British Columbia (BC) coast.

Implementation is done using a modified version of the Coleraine statistical catch-at-age software (Hilborn *et al.* 2003) called Awatea (Alan Hicks, NOAA, pers. comm.). Awatea is a platform for implementing the AD (Automatic Differentiation) Model Builder software (Otter Research 1999), which provides (a) maximum posterior density estimates using a function minimiser and automatic differentiation, and (b) an approximation of the posterior distribution of the parameters using the Markov Chain Monte Carlo (MCMC) method, specifically using the Hastings-Metropolis algorithm (Gelman *et al.* 2004).

Running of Awatea is streamlined using code written in R (R Development Core Team 2009), rather than the original Microsoft Excel implementation. Figures and tables of output are automatically produced through R using code adapted from the R packages **scape** (Magnusson 2009) and **scapeMCMC** (Magnusson and Stewart 2007). We use the R function `Sweave` (Leisch 2008) in the package **utils** to automatically collate, via LATEX, the large amount of figures and tables into a single portable document file (.pdf) for each model run.

We provide master `Sweave` files used in folder `../library/PBSawatea/snw` to build the .pdf document. The user must copy these to a local working directory if they are not already there.

plotB2

*Plot Biomass, Recruitment, and Landings (AME Version)***Description**

Plot scape model predicted biomass, stock recruitment, and landings.

AME: This is an alteration of Arni Magnussons `plotB` function to accommodate PJS's request not to show biomass prior to fishery and survey indices period.

Usage

```
plotB2(model, what="d", series=NULL, years=NULL, axes=TRUE, div=1,
       legend="bottom", main="", xlab="", ylab="", cex.main=1.2,
       cex.legend=1, cex.lab=1, cex.axis=0.8, las=1,
       tck=c(1,what=="d")/2, tick.number=5, lty.grid=3, col.grid="white",
       pch=16, cex.points=0.8, col.points="black", lty.lines=1:3,
       lwd.lines=2, col.lines="black", ratio.bars=3, col.bars="grey",
       plot=TRUE, ...)
```

Arguments

<code>model</code>	fitted scape model.
<code>what</code>	what to plot: "d"[efault], "s"[tock recruitment], or "l"[andings].
<code>series</code>	vector of strings indicating which column names in <code>model\$B</code> data frame to plot (all by default).
<code>years</code>	vector of numbers indicating which years to include (all by default).
<code>axes</code>	whether to plot axis values.
<code>div</code>	denominator to shorten values on the y axis, or a vector with two elements referring to x and y axis.
<code>legend</code>	legend location: "bottom", "left", "top", "right", or "" to suppress legend.
<code>main</code>	main title.
<code>xlab</code>	x-axis label.
<code>ylab</code>	y-axis label.
<code>cex.main</code>	size of main title.
<code>cex.legend</code>	size of legend text.
<code>cex.lab</code>	size of axis labels.
<code>cex.axis</code>	size of tick labels.
<code>las</code>	orientation of tick labels: 0=parallel, 1=horizontal, 2=perpendicular, 3=vertical.
<code>tck</code>	tick mark length.
<code>tick.number</code>	number of tick marks.

<code>lty.grid</code>	line type of gridlines.
<code>col.grid</code>	color of gridlines.
<code>pch</code>	symbol for points.
<code>cex.points</code>	size of points.
<code>col.points</code>	color of points.
<code>lty.lines</code>	line type of main lines.
<code>lwd.lines</code>	line width of main lines.
<code>col.lines</code>	color of main lines.
<code>ratio.bars</code>	width of bars.
<code>col.bars</code>	color of bars.
<code>plot</code>	whether to draw plot.
<code>...</code>	passed to <code>xyplot</code> and <code>panel.superpose</code> .

Details

The "d"[efault] plot shows spawning biomass and vulnerable biomass as lines, and landings as bars, on the same scale.

Value

When `plot=TRUE`, a trellis plot is drawn and a data frame is returned, containing the data used for plotting. When `plot=FALSE`, a trellis object is returned.

Note

The `Args` function from the **gdata** package is recommended for reviewing the arguments, instead of `args`.

See Also

[xyplot](#), [panel.barchart](#), and [panel.superpose](#) are the underlying drawing functions.

[plotCA](#), [plotCL](#), [plotIndex](#), [plotIndex2](#) and [plotLA](#) plot model fit and data.

[plotB](#), [plotN](#), and [plotSel](#) plot derived quantities.

[scape-package](#) gives an overview of the **scapeMCMC** package.

plotBmcmcPOP

*Plot Spawning and Vulnerable Biomass***Description**

Plot spawning and vulnerable biomass from posterior as boxplots, and add catch bars on same graph.

Usage

```
plotBmcmcPOP( obj, currentRes1=currentRes,
               p=c(0.025,0.25,0.5,0.75,0.975),
               xyType="quantBox",
               lineType=c(3,2,1,2,3),
               refLines=NULL, xLim=NULL, yLim=NULL,
               userPrompt=FALSE, save=T, xLab=c(1939,1939,1939),
               yLab=c(10000,70000,170000),
               textLab=c("catch","spawning","vulnerable"),
               yaxis.by=10000, tcl.val=-0.2, ...)
```

Arguments

obj	MCMC data frame of B (currentMCMC\$B).
currentRes1	list/scape object created by <code>importCol2</code> .
p	quantiles to use in <code>quantBox</code> .
xyType	type of plot (currently only uses <code>quantBox</code>).
lineType	line types to use in <code>quantBox</code> .
refLines	reference lines to add to plot.
xLim	limits of the x-axis.
yLim	limits of the y-axis.
userPrompt	not used
save	not used
xLab	x-coordinates for labels.
yLab	y-coordinates for labels.
textLab	text labels to display on plot.
yaxis.by	increments along the y-axis to place tick marks.
tcl.val	tick length.
...	additional arguments passed to the function <code>rect</code> .

Note

Combines ideas from `plt.quantBio` and `plotB2`. Don't need lattice, just one figure, no panels. Vulnerable biomass has no posterior saved, which must be why it's not been done before. Hmmm.... still worth seeing spawning though?

Taking what is needed from `plt.quantBio`, this basically works:

```
plt.quantBio(currentMCMC$B, xyType=rpType),
though it creates 2x3 plots. The object should be the specific MCMC posterior by year (so just a
data frame), e.g., currentMCMC$B.
currentRes1 is local currentRes.
```

plotChains

Plot Cumulative Frequency of MCMC Chains

Description

Plot cumulative frequency of n chains by partitioning one trace.
(Modified from the function `plotTracePOP`.)

Usage

```
plotChains(mcmc, nchains=3, pdisc=0.1, axes=FALSE, same.limits=FALSE,
  between=list(x=axes,y=axes), div=1, span=1/4, log=FALSE,
  base=10, main=NULL, xlab=NULL, ylab=NULL, cex.main=1.2,
  cex.lab=1, cex.strip=0.8, cex.axis=0.8,
  las=0, tck=0.5, tick.number=5, lty.trace=1, lwd.trace=1,
  col.trace="grey", lty.median=1, lwd.median=1,
  col.median="black", lty.quant=2, lwd.quant=1,
  col.quant="black", plot=TRUE, probs=c(0.025, 0.5, 0.975), ...)
```

Arguments

<code>mcmc</code>	MCMC chain(s) as a vector, data frame or <code>mcmc</code> object.
<code>ncchains</code>	number of chains to create from one trace.
<code>pdisc</code>	proportion of the initial trace to discard before creating chains.
<code>axes</code>	whether axis values should be plotted.
<code>same.limits</code>	whether panels should have same x-axis limits.
<code>between</code>	list with <code>x</code> and <code>y</code> indicating panel spacing.

<code>div</code>	denominator to shorten values on the y axis.
<code>span</code>	smoothness parameter (not used).
<code>log</code>	whether values should be log-transformed.
<code>base</code>	logarithm base.
<code>main</code>	main title.
<code>xlab</code>	x-axis title.
<code>ylab</code>	y-axis title.
<code>cex.main</code>	size of main title.
<code>cex.lab</code>	size of axis labels.
<code>cex.strip</code>	size of strip labels.
<code>cex.axis</code>	size of tick labels.
<code>las</code>	orientation of tick labels: 0=parallel, 1=horizontal, 2=perpendicular, 3=vertical.
<code>tck</code>	tick mark length.
<code>tick.number</code>	number of tick marks.
<code>lty.trace</code>	line type of trace.
<code>lwd.trace</code>	line width of trace.
<code>col.trace</code>	colour of trace.
<code>lty.median</code>	line type of median.
<code>lwd.median</code>	line width of median.
<code>col.median</code>	colour of median.
<code>lty.quant</code>	line type of quantile trace.
<code>lwd.quant</code>	line width of quantile trace.
<code>col.quant</code>	colour of quantile trace.
<code>plot</code>	whether to draw plot.
<code>probs</code>	quantile values for quantile trace.
<code>...</code>	passed to <code>panel.trace</code> (not used).

Value

When `plot=TRUE`, a trellis plot is drawn and a data frame is returned, containing the data used for plotting. When `plot=FALSE`, a trellis object is returned.

Note

This idea stemmed from a discussion with PJS.

`plotCPUE`*Plot CPUE and Add Error Bars*

Description

Plot CPUE and fit with error bars.

Usage

```
plotCPUE(obj, main="", save=NULL, bar=1.96, yLim=NULL, ...)
```

Arguments

<code>obj</code>	data frame of CPUE indices from Awatea's results file (<i>e.g.</i> , <code>currentRes\$CPUE</code>).
<code>main</code>	title for figure
<code>save</code>	not used
<code>bar</code>	standard deviation of the normal distribution (1.96 is the approximate value of the 97.5 percentile point).
<code>yLim</code>	limits of the y-axis.
<code>...</code>	not used

Value

A postscript file:
`CPUEser.eps`...CPUE indices with error bars.

Note

Copied code from `plotIndexNotLattice`.

plotDensPOP

*Plot MCMC Density (AME Version)***Description**

Plot Markov-chain Monte Carlo density. This is an approximation of the posterior probability density function.

Usage

```
plotDensPOP(mcmc, probs=c(0.025,0.975), points=FALSE, axes=TRUE,
  same.limits=FALSE, between=list(x=axes,y=axes), div=1,
  log=FALSE, base=10, main=NULL, xlab=NULL, ylab=NULL,
  cex.main=1.2, cex.lab=1, cex.strip=0.8, cex.axis=0.7,
  las=0, tck=0.5, tick.number=5,
  lty.density=1, lwd.density=3, col.density="black",
  lty.median=2, lwd.median=1, col.median="darkgrey",
  lty.outer=3, lwd.outer=1, col.outer="darkgrey", pch="|",
  cex.points=1, col.points="black", plot=TRUE, MPD.height=0.04,...)
```

```
plotDensPOPpars(mcmc, probs=c(0.025,0.975), points=FALSE,
  axes=TRUE, same.limits=FALSE, between=list(x=axes,y=axes),
  div=1, log=FALSE, base=10, main=NULL, xlab=NULL, ylab=NULL,
  cex.main=1.2, cex.lab=1, cex.strip=0.8, cex.axis=0.7,
  las=0, tck=0.5, tick.number=5,
  lty.density=1, lwd.density=3, col.density="black",
  lty.median=2, lwd.median=1, col.median="darkgrey",
  lty.outer=3, lwd.outer=1, col.outer="darkgrey", pch="|",
  cex.points=1, col.points="black", plot=TRUE, MPD.height=0.04,...)
```

```
plotDensPOPparsPrior(mcmc, probs=c(0.025,0.975), points=FALSE,
  axes=TRUE, same.limits=FALSE, between=list(x=axes,y=axes),
  div=1, log=FALSE, base=10, main=NULL, xlab=NULL, ylab=NULL,
  cex.main=1.2, cex.lab=1, cex.strip=0.8, cex.axis=0.7,
  las=0, tck=0.5, tick.number=5,
  lty.density=1, lwd.density=3, col.density="black",
  lty.median=2, lwd.median=1, col.median="darkgrey",
  lty.outer=3, lwd.outer=1, col.outer="darkgrey", pch="|",
  cex.points=1, col.points="black", plot=TRUE, MPD.height=0.04,...)
```

Arguments

mcmc	MCMC chain(s) as a vector, data frame or mcmc object.
probs	vector of outer quantiles to draw, besides the median.
points	whether data points should be plotted along the x axis.
axes	whether axis values should be plotted.

<code>same.limits</code>	whether panels should have same x-axis limits.
<code>between</code>	list with <code>x</code> and <code>y</code> indicating panel spacing.
<code>div</code>	denominator to shorten values on the x axis.
<code>log</code>	whether values should be log-transformed.
<code>base</code>	logarithm base.
<code>main</code>	main title.
<code>xlab</code>	x-axis label.
<code>ylab</code>	y-axis label.
<code>cex.main</code>	size of main title.
<code>cex.lab</code>	size of axis labels.
<code>cex.strip</code>	size of strip labels.
<code>cex.axis</code>	size of tick labels.
<code>las</code>	orientation of tick labels: 0=parallel, 1=horizontal, 2=perpendicular, 3=vertical.
<code>tck</code>	tick mark length.
<code>tick.number</code>	number of tick marks.
<code>lty.density</code>	line type of density curve.
<code>lwd.density</code>	line width of density curve.
<code>col.density</code>	colour of density curve.
<code>lty.median</code>	line type of median.
<code>lwd.median</code>	line width of median.
<code>col.median</code>	colour of median.
<code>lty.outer</code>	line type of outer quantiles.
<code>lwd.outer</code>	line width of outer quantiles.
<code>col.outer</code>	colour of outer quantiles.
<code>pch</code>	symbol for data points.
<code>cex.points</code>	size of data points.
<code>col.points</code>	colour of data points.
<code>plot</code>	whether to draw plot.
<code>MPD.height</code>	how far up to put MPD.
<code>...</code>	passed to <code>densityplot</code> and <code>panel.densityplot</code> .

Details

The function `plotDensPOPpars` differs from `plotDensPOP` only by a few tweaks to the internal list object `myscales`.

The function `plotDensPOPparsPrior` adds the priors automatically.

Value

When `plot=TRUE`, a trellis plot is drawn and a data frame is returned, containing the data used for plotting. When `plot=FALSE`, a trellis object is returned.

Note

The `Args` function from the **gdata** package is recommended for reviewing the arguments, instead of `args`.

AME: edited `plotDens` function to have less whitesapce, not repeat x-axis labels, and make y-axes the same scales. Cannot just do it through the options.

For Recruits and Biomass, use `plotDensPOppars` for parameters. Tried y-axes the same scales, but 1973–1975 are so narrow that they make all the others really small: `same.limits=TRUE, ylim=c(0, 0.0005)`.

See Also

`xyplot` and `panel.densityplot` are the underlying drawing functions, and `densplot` is a similar non-trellis plot.

`plotTrace`, `plotAuto`, `plotCumu`, and `plotSplom` are diagnostic plots.

`plotDens` and `plotQuant` are posterior plots.

`scapeMCMC-package` gives an overview of the package.

plotIndex2

Plot Abundance Index (AME Version)

Description

Plot scape model fit to abundance index data.

Revised version of Arni's function to confine plotting to data region.

Usage

```
plotIndex2(model, what="c", series=NULL, axes=TRUE, same.limits=FALSE,
            between=list(x=axes,y=axes), ylim=NULL, q=1, bar=1, log=FALSE,
            base=10, main="", xlab="", ylab="", cex.main=1.2, cex.lab=1,
            cex.strip=0.8, cex.axis=0.8, las=1, tck=c(1,0)/2,
            tick.number=5, lty.grid=3, col.grid="white", pch=16,
            cex.points=1.2, col.points="black", lty.lines=1, lwd.lines=4,
            col.lines="dimgrey", lty.bar=1, plot=TRUE, ...)
```

Arguments

<code>model</code>	fitted scape model containing element CPUE and/or Survey.
<code>what</code>	what to plot: "c"[ommercial] or "s"[urvey] abundance index.
<code>series</code>	vector of strings indicating which gears or surveys to plot (all by default).
<code>axes</code>	whether to plot axis values.
<code>same.limits</code>	whether panels should have same y-axis limits.
<code>between</code>	list with x and y indicating panel spacing.

<code>ylim</code>	vector with lower and upper y-axis limits.
<code>q</code>	denominator to scale the y axis, e.g. to vulnerable biomass. Similar to the <code>div</code> argument in <code>plotN</code> and <code>plotB</code> .
<code>bar</code>	extent of error bars relative to standard error.
<code>log</code>	whether to log-transform values.
<code>base</code>	logarithm base.
<code>main</code>	main title.
<code>xlab</code>	x-axis label.
<code>ylab</code>	y-axis label.
<code>cex.main</code>	size of main title.
<code>cex.lab</code>	size of axis labels.
<code>cex.strip</code>	size of strip labels.
<code>cex.axis</code>	size of tick labels.
<code>las</code>	orientation of tick labels: 0=parallel, 1=horizontal, 2=perpendicular, 3=vertical.
<code>tck</code>	tick mark length.
<code>tick.number</code>	number of tick marks.
<code>lty.grid</code>	line type of gridlines.
<code>col.grid</code>	color of gridlines.
<code>pch</code>	symbol for points.
<code>cex.points</code>	size of points.
<code>col.points</code>	color of points and error bars.
<code>lty.lines</code>	line type of main lines.
<code>lwd.lines</code>	line width of main lines.
<code>col.lines</code>	color of main lines.
<code>lty.bar</code>	line type of error bars.
<code>plot</code>	whether to draw plot.
<code>...</code>	passed to <code>xyplot</code> , <code>panel.xyplot</code> , and <code>panel.xYplot</code> .

Value

When `plot=TRUE`, a trellis plot is drawn and a data frame is returned, containing the data used for plotting. When `plot=FALSE`, a trellis object is returned.

Note

The `Args` function from the **gdata** package is recommended for reviewing the arguments, instead of `args`.

See Also

[xyplot](#), [panel.xyplot](#), and [panel.xYplot](#) are the underlying drawing functions.
[plotCA](#), [plotCL](#), [plotIndex](#), and [plotLA](#) plot model fit and data.
[plotB](#), [plotB2](#), [plotN](#), and [plotSel](#) plot derived quantities.
[scape-package](#) gives an overview of the package.

plotIndexNotLattice

Plot Survey Indices

Description

Plot index series with error bars. Create postscript files automatically.

Usage

```
plotIndexNotLattice(obj, objCPUE, main="", save=NULL, bar=1.96, ...)
```

Arguments

obj	data frame of survey indices from Awatea's results file (<i>e.g.</i> , <code>currentRes\$Survey</code>).
objCPUE	data frame of CPUE indices from Awatea's results file (<i>e.g.</i> , <code>currentRes\$CPUE</code>).
main	title for figure
save	not used
bar	standard deviation of the normal distribution (1.96 is the approximate value of the 97.5 percentile point).
...	not used

Value

Four postscript files:

`survIndSer.eps` . . . each survey panel focuses on the years of the survey;
`survIndSer2.eps` . . . each panel uses a fixed set of years that span all surveys;
`survIndSer3.eps` . . . one panel showing all series normalised to their means;
`survIndSer4.eps` . . . compares normalised GIG series with CPUE series.

plotRmcmcPOP

*Plot Recruitment Posterior Quantiles***Description**

Plot recruitment posteriors quantiles as one graph over time.

Usage

```
plotRmcmcPOP ( obj,
               p=c(0.025,0.25,0.5,0.75,0.975),
               xyType="quantBox",
               lineType=c(3,2,1,2,3),
               refLines=NULL, xLim=NULL, yLim=NULL,
               userPrompt=FALSE, save=T, tcl.val=-0.2,
               yaxis.by=10000, yLab="Recruitment", ...)
```

Arguments

obj	MCMC data frame of R (currentMCMC\$R).
p	quantiles to use in quantBox.
xyType	type of plot (currently only uses quantBox).
lineType	line types to use in quantBox.
refLines	reference lines to add to plot.
xLim	limits of the x-axis.
yLim	limits of the y-axis.
userPrompt	not used
save	not used
tcl.val	tick length.
yaxis.by	increments along the y-axis to place tick marks.
yLab	label for the y-axis.
...	additional arguments passed to the function rect.

Note

AME: Plot recruitment posteriors quantiles as one graph over time.

Already have the full posterior densities done.

Using plotBmcmcPOP as template, but will be simpler as no extra stuff. Probably not simplifying down as much as could due to time constraints.

Adding yLab and then using for exploitation plot also.

Author(s)

Andrew Edwards, Pacific Biological Station, Fisheries and Oceans Canada, Nanaimo BC

See Also

[plotBmcmcPOP](#), [plotB2](#)

plotSnail

Plot Snail Trails of Exploitation vs. Biomass

Description

Plot the historical progression of the ratio u_t/u_{MSY} against B_t/B_{MSY} .

Usage

```
plotSnail(BoverBmsy, UoverUmsy, p=c(0.1,0.9),
          xLim=NULL, yLim=NULL, Lwd=2)
```

Arguments

BoverBmsy	numeric matrix of B_t over B_{MSY} .
UoverUmsy	numeric matrix of u_t over u_{MSY} .
p	quantiles to show the bulk of the distribution.
xLim	limits of the x-axis.
yLim	limits of the y-axis.
Lwd	line width of the snail trail.

Details

The graph attempts to show the time history of the exploitation rate compared to the spawning biomass using a precautionary framework recast in Bayesian terms.

Note

The term *snail trail* comes from PJS.

plotTracePOP	<i>Plot MCMC Traces (AME Version)</i>
--------------	---------------------------------------

Description

Plot Markov-chain Monte Carlo traces. This is a diagnostic plot for deciding whether a chain shows unwanted trends by showing the trace of moving quantiles. (Modified from the **scapeMCMC** function plotTrace.)

Usage

```
plotTracePOP(mcmc, axes=FALSE, same.limits=FALSE,
             between=list(x=axes,y=axes), div=1, span=1/4, log=FALSE,
             base=10, main=NULL, xlab=NULL, ylab=NULL, cex.main=1.2,
             cex.lab=1, cex.strip=0.8, cex.axis=0.8,
             las=0, tck=0.5, tick.number=5, lty.trace=1, lwd.trace=1,
             col.trace="grey", lty.median=1, lwd.median=1,
             col.median="black", lty.quant=2, lwd.quant=1,
             col.quant="black", plot=TRUE, probs=c(0.025, 0.5, 0.975), ...)
```

Arguments

mcmc	MCMC chain(s) as a vector, data frame or mcmc object.
axes	whether axis values should be plotted.
same.limits	whether panels should have same x-axis limits.
between	list with x and y indicating panel spacing.
div	denominator to shorten values on the y axis.
span	smoothness parameter (not used).
log	whether values should be log-transformed.
base	logarithm base.
main	main title.
xlab	x-axis title.
ylab	y-axis title.
cex.main	size of main title.
cex.lab	size of axis labels.
cex.strip	size of strip labels.
cex.axis	size of tick labels.
las	orientation of tick labels: 0=parallel, 1=horizontal, 2=perpendicular, 3=vertical.
tck	tick mark length.
tick.number	number of tick marks.
lty.trace	line type of trace.

lwd.trace	line width of trace.
col.trace	colour of trace.
lty.median	line type of median.
lwd.median	line width of median.
col.median	colour of median.
lty.quant	line type of quantile trace.
lwd.quant	line width of quantile trace.
col.quant	colour of quantile trace.
plot	whether to draw plot.
probs	quantile values for quantile trace.
...	passed to panel.trace (not used).

Value

When `plot=TRUE`, a trellis plot is drawn and a data frame is returned, containing the data used for plotting. When `plot=FALSE`, a trellis object is returned.

Note

The `Args` function from the **gdata** package is recommended for reviewing the arguments, instead of `args`.

See Also

[xyplot](#) and [panel.loess](#) are the underlying drawing functions, and [traceplot](#) is a similar non-trellis plot.

[plotTracePOP](#), [plotAuto](#), [plotCumu](#), and [plotSpIom](#) are diagnostic plots.

[plotDensPOP](#), [plotDens](#), [plotQuant](#), and [plotChains](#) are posterior plots.

[scapeMCMC-package](#) gives an overview of the **scapeMCMC** package.

plotVBcatch	<i>Plot Vulnerable Biomass</i>
-------------	--------------------------------

Description

Plot vulnerable biomass from posterior as boxplots, and add catch bars on same graph.

Usage

```
plotVBcatch( obj, currentRes1=currentRes,
             p=c(0.025,0.25,0.5,0.75,0.975),
             xyType="quantBox",
             lineType=c(3,2,1,2,3),
             refLines=NULL, xLim=NULL, yLim=NULL,
             userPrompt=FALSE, save=T, xLab = c(1939,1939),
             yLab=c(10000,220000),
             textLab=c("catch","vulnerable"),
             yaxis.by=10000, tcl.val=-0.2, ...)
```

Arguments

obj	MCMC data frame of B (currentMCMC\$B).
currentRes1	list/scape object created by <code>importCol2</code> .
p	quantiles to use in quantBox.
xyType	type of plot (currently only uses quantBox).
lineType	line types to use in quantBox.
refLines	reference lines to add to plot.
xLim	limits of the x-axis.
yLim	limits of the y-axis.
userPrompt	not used
save	not used
xLab	x-coordinates for labels.
yLab	y-coordinates for labels.
textLab	text labels to display on plot.
yaxis.by	increments along the y-axis to place tick marks.
tcl.val	tick length.
...	additional arguments passed to the function <code>rect</code> .

Note

AME: This function is essentially a tweak of `plotBmcmcPOP`.

plotVBnorm

*Plot Spawning and Vulnerable Biomass Relative to Virgin***Description**

Plot spawning and vulnerable biomass boxplots relative to virgin levels B_0 and V_0 , respectively.

Usage

```
plotVBnorm( mcmcObj,
             p=c(0.025,0.25,0.5,0.75,0.975),
             xyType="quantBox",
             lineType=c(3,2,1,2,3),
             refLines=NULL, xLim=NULL, yLim=NULL,
             userPrompt=FALSE, save=T, xLeg=0.7, yLeg=0.9,
             yaxis.by=0.02, tcl.val=-0.2,
             B.col="black", VB.col="black", ...)

plotBVBnorm(mcmcObj,
             p=c(0.025,0.25,0.5,0.75,0.975),
             xyType="quantBox",
             lineType=c(3,2,1,2,3),
             refLines=NULL, xLim=NULL, yLim=NULL,
             userPrompt=FALSE, save=T, xLeg=0.7, yLeg=0.9,
             yaxis.by=0.02, tcl.val=-0.2,
             B.col="black", VB.col="black", ...)
```

Arguments

mcmcObj	MCMC list object (currentMCMC).
p	quantiles to use in quantBox.
xyType	type of plot (currently only uses quantBox).
lineType	line types to use in quantBox.
refLines	reference lines to add to plot.
xLim	limits of the x-axis.
yLim	limits of the y-axis.
userPrompt	not used
save	not used
xLeg	x-coordinate for legend.
yLeg	y-coordinate for legend.
yaxis.by	increments along the y-axis to place tick marks.
tcl.val	tick length.
B.col	colour for spawning biomass.
VB.col	colour for vulnerable biomass.
...	not used

Note

AME: tried in separate file, but then changed that to lattice and wouldn't be good format for Arni's boxplots.

Based on plotVBcatch (tweaking some).
currentRes1 is local currentRes.

Author(s)

Andrew Edwards, Pacific Biological Station, Fisheries and Oceans Canada, Nanaimo BC

plt.ageResidsPOP *Plot Model Residuals*

Description

Plot model residuals as boxplots or qq-plots.

Usage

```
plt.ageResidsPOP (obj, ages=c(2,60), pct=c(5,25,50,75,95), main=NULL)
plt.ageResidsqqPOP (obj, ages=c(2,60), pct=c(5,25,50,75,95), main=NULL)
plt.yearResidsPOP (obj, ages=c(2,60), pct=c(5,25,50,75,95),
                  main=NULL, fill.in=TRUE, ... )
plt.cohortResids (obj, ages=c(2,59), pct=c(5,25,50,75,95), main=NULL)
```

Arguments

obj	output from stdRes.CA .
ages	age classes to plot.
pct	quantiles to show in boxplot or qq-plot.
main	title for plot if desired.
fill.in	logical: if TRUE, add missing years to boxplot.
...	additional arguments for boxplot.

Details

```
plt.ageResidsPOP....plot age class residuals as boxplots.
plt.ageResidsqqPOP...plot age class residuals as qq-plot.
plt.yearResidsPOP....plot age residuals by year as boxplots.
plt.cohortResids....plot age residuals by cohort as boxplots.
```

Note

Some trouble noted adding text and legend.

`plt.allTraces`

Plot MCMC Traces

Description

Plot traces from MCMC samples.

Usage

```
plt.allTraces(obj, bioYrList=NULL, recYrList=NULL, save=TRUE)
```

Arguments

<code>obj</code>	vector of MCMC samples.
<code>bioYrList</code>	years to plot spawning biomass traces.
<code>recYrList</code>	years to plot recruitment traces.
<code>save</code>	logical: if TRUE, save figure to a raster file (.jpg).

Note

Appears to be some figure requested by PJS.

Author(s)

Andrew Edwards, Pacific Biological Station, Fisheries and Oceans Canada, Nanaimo BC

See Also

[plotChains](#)

plt.expRate	<i>Plot Exploitation Rate</i>
-------------	-------------------------------

Description

Plot exploitation rate against year.

Usage

```
plt.expRate(obj, yLim=c(0,0.5), xLim=c(1954,2005))
```

Arguments

obj	an object from <code>load.allResFiles</code> .
yLim	limits of the y-axis.
xLim	limits of the x-axis.

Details

Simple points and lines plot.

Author(s)

Andrew Edwards, Pacific Biological Station, Fisheries and Oceans Canada, Nanaimo BC

See Also

[plt.idx](#)

plt.idx	<i>Plot Survey Index Residuals</i>
---------	------------------------------------

Description

Plot the survey index residuals as a quantile-quantile plot (see [qqnorm](#)).

Usage

```
plt.idx(obj, main="Residuals", save=NULL, ...)
```

Arguments

obj	a data frame with columns <code>Year</code> , <code>stdRes</code> , and <code>Fit</code> .
main	title for the plot.
save	logical: if TRUE, save the figure to a raster file (<code>.png</code>).
...	not used

Details

QQ-plots show sample quantiles vs. theoretical quantiles.

Note

The `save` option has been disabled for some reason.

Author(s)

Andrew Edwards, Pacific Biological Station, Fisheries and Oceans Canada, Nanaimo BC

See Also

`plt.stdResids`, `plotIndexNotLattice`

`plt.mpdGraphs`

Plot a Set of Figures for MPD and MCMC

Description

Plot a set of postscript figures `.eps` for the MPD (mode of the posterior distribution) and MCMC (Monte Carlo Markoff Chain) results.

Usage

```
plt.mpdGraphs(obj, save = FALSE)
plt.mcmcGraphs(mcmcObj, projObj, save=FALSE, xlimrec=c(0, 2e+05))
```

Arguments

<code>obj</code>	an Awatea results object (e.g., <code>currentRes</code>).
<code>mcmcObj</code>	an Awatea MCMC object (e.g., <code>currentMCMC</code>).
<code>projObj</code>	an Awatea projected biomass object (e.g., <code>currentProj</code>).
<code>save</code>	not used
<code>xlimrec</code>	range for recruitments (not used).

Details

Creates a whole heap o postscript files.

Value

plt.mpdGraphs creates the following postscript files:

```
exploit.eps..... annual exploitation rate,
recruits.eps..... annual recruitment at age 1,
selectivity.eps..... selectivity curves for commercial gear(s) and survey(s),
ageComm.eps..... fits to annual commercial age composition (panel plots),
ageSurv.eps..... fits to annual survey age composition (panel plots),
survIndSer.eps..... four figures of survey indices (calls plotIndexNotLattice),
CPUEser.eps..... CPUE indices with error bars (calls plotCPUE),
commAgeResids.eps..... standardised residuals for commercial gear,
survAgeResidsSer.eps..... standardised residuals for surveys,
meanAge.eps..... mean age for catch and surveys,
stockRecruit.eps..... stock recruitment function.
```

plt.mcmcGraphs creates the following postscript files:

```
recruitsMCMC.eps..... boxplots of annual MCMC recruitment,
exploitMCMC.eps..... boxplots of annual MCMC exploitation rate,
pdfBiomass.eps..... density panel plots of annual female spawning biomass,
pdfRecruitment.eps..... density panel plots of annual recruitment,
selectivityMCMC.eps..... not currently implemented,
traceRecruits.eps..... panel plots of annual recruitment traces with running quantiles,
traceBiomass.eps..... panel plots of annual spawning biomass with running quantiles,
traceParams.eps..... panel plots of parameter traces with running quantiles,
splitChain.eps..... panel plots of cumulative parameter estimate chains,
VBcatch.eps..... boxplots of annual vulnerable biomass and barplots of catch,
BVBnorm.eps..... spawning and vulnerable biomass relative to their virgin levels,
Bproj.eps..... boxplots of spawning biomass – MCMCs and projections,
snail.eps..... time series of  $u_t/u_{MSY}$  vs.  $B_t/B_{MSY}$ ,
pairs[1,2,3].eps..... pairs plot of parameter MCMC samples.
```

Note

The function `plt.mpdGraphs` needs some cleaning up. For example, there appears to be extensive reliance on the object `currentRes` whereas the function should be using `obj`, which is the actual results object within the function.

The same is true for `plt.mcmcGraphs` where the global objects `currentMCMC` and `currentProj` are used within the function rather than using the local objects `mcmcObj` and `projObj`.

plt.numR

Plot Numbers at Age at Equilibrium

Description

Plot numbers at age at equilibrium. Plot recruitment (age 1).

Usage

```
plt.numR(obj, minYr = NULL)
```

Arguments

obj an Awatea results object from load.allResFiles.
minYr minimum year to display in plot.

Note

Not sure what this plot is used for (RH).

[plotRmcmcPOP](#)

plt.quantBio

Plot Quantile Boxes of MCMC and Projected Biomass

Description

Plots MCMC and projected biomass as quantile boxes, the former in black, the latter in red.

Usage

```
plt.quantBio(obj, projObj=NULL, policy=NULL,
  p=c(0.025,0.25,0.5,0.75,0.975), xyType="lines",
  lineType=c(3,2,1,2,3), refLines=NULL,
  xLim=NULL, yLim=NULL, userPrompt=FALSE, save=T)
```

```
plt.quantBioBB0(obj, projObj=NULL, policy=NULL,
  p=c(0.025,0.25,0.5,0.75,0.975), xyType="lines",
  lineType=c(3,2,1,2,3), refLines=NULL,
  xLim=NULL, yLim=NULL, userPrompt=FALSE, save=T)
```

```
main="", cex.main="", tcl.val=-0.2,
xaxis.by=1, yaxis.by=10000, xaxis.lab="Year",
yaxis.lab="Spawning biomass"
```

Arguments

obj	an Awatea MCMC object (<i>e.g.</i> , currentMCMC).
projObj	an Awatea projected biomass object (<i>e.g.</i> , currentProj).
policy	numeric vector specifying catch policy.
p	quantiles to use from the biomass samples.
xyType	string specifying type of plot.
lineType	line types for the quantiles if xyType="lines".
refLines	reference points.
xLim	limits of the x-axis.
yLim	limits of the y-axis.
userPrompt	logical: if TRUE prompts user before figure is drawn.
save	logical: if TRUE save figure as a raster file .png.
main	character string specifying a title for the plot.
cex.main	font size for figure title.
tcl.val	tick length.
xaxis.by	tick mark intervals for x-axis.
yaxis.by	tick mark intervals for y-axis.
xaxis.lab	label for x-axis.
yaxis.lab	label for y-axis.

Value

List of the reconstructed (MCMC) and projected results.

Note

plt.quantBioBB0 performs similarly as for plt.quantBio but uses B_t/B_0 instead of B_t .

Author(s)

Andrew Edwards, Pacific Biological Station, Fisheries and Oceans Canada, Nanaimo BC

plt.ssbVbCatch *Plot Annual Spawning and Vulnerable Biomass*

Description

Plot MPD values of spawning biomass (SB) and vulnerable biomass(VB), as well as catch, against year.

Usage

```
plt.ssbVbCatch(obj, x1=1966, xLim=c(1954,2005), yLim=c(0,25000))
```

Arguments

obj	an Awatea results object from load.allResFiles.
x1	year to start plotting SB and VB lines.
xLim	limits of the x-axis.
yLim	limits of the y-axis.

Note

This analysis uses the MPD (mode of the posterior distribution) values for B and V .

plt.stdResids *Plot Diagnostics for Standardised Residuals*

Description

Plot standardised residuals against year, fitted value, and theoretical residuals.

Usage

```
plt.stdResids(obj, pct=c(5,25,50,75,95),
  main=NULL, yLim=NULL, xLim=xLim)
```

Arguments

<code>obj</code>	a data frame with columns <code>Year</code> , <code>stdRes</code> , and <code>Fit</code> .
<code>pct</code>	percentiles to display as horizontal lines on the quantile-quantile plot.
<code>main</code>	title for the figure.
<code>yLim</code>	limits of the y-axis.
<code>xLim</code>	limits of the x-axis.

Details

Figure provides three panels of standardised residuals *vs.*
(i) years, (ii) fitted or predicted values, and (iii) theoretical quantiles.

[`plt.ssbVbCatch`](#)

`readAD`*Read ADMB Input and Create AWATEA Class Object*

Description

Read the ADMB input file and create an AWATEA class object.

Usage

```
readAD(txt)
```

Arguments

<code>txt</code>	string name of an Awatea input file.
------------------	--------------------------------------

Details

The Awatea input file contains headers (lines prefixed with "#") and data that are read sequentially into the model by the binary executable `Awatea.exe`.

Value

An AWATEA class cobject with the slots:

txtnam.....character: name of the input file,
 input.....character: vector of strings that are the lines of the input file,
 vlst.....list: each line of the input file with a label specifying line number and
indicating whether the line is a Comment or Data,
 dnam.....character: vector of strings specifying data contents labelled by line number,
 nvars.....numeric: number of data variables,
 vdesc.....character: vector of strings specifying data contents labelled by
variable number (e.g., v001),
 vars.....list: numeric values of data labelled by variable number,
 gcomm.....character: vector of comments labelled by line number,
 vcomm.....character: vector of variable names labelled by line number,
 output.....list: Awatea results file imported by function [importRes](#),
 reweight...list: empty (later populated by function [reweight](#)).

 refPoints

Calculate Reference Points

Description

Calculate reference points relative to either B_{MSY} or B_0 .

Usage

```
refPoints(mcmcObj=currentMCMC, projObj=currentProj,
          msyObj=currentMSY, refLevels=c(0.4,0.8,1))

refPointsB0(mcmcObj=currentMCMC, projObj=currentProj,
            B0Obj=B0.MCMC, refLevels=B0refLevels, refNames=B0refNames)
```

Arguments

mcmcObj	MCMC list object (<i>e.g.</i> , currentMCMC).
projObj	projected biomass list object (<i>e.g.</i> , currentProj).
msyObj	MSY list object (<i>e.g.</i> , currentMSY).
refLevels	reference levels relative to B_{MSY} (or B_0).
B0Obj	vector of B_0 MCMC values (<i>e.g.</i> , B0.MCMC).
refNames	names of the B_0 reference levels refLevels.

Value

List of reference points relative to either B_{MSY} or B_0 .

Note

Call from Sweave as `refPoints()` or, in full:

```
refPoints(currentMCMC, currentProj, currentMSY, refLevels=c(0.4, 0.8, 1))
```

Author(s)

Andrew Edwards, Pacific Biological Station, Fisheries and Oceans Canada, Nanaimo BC

See Also

[calc.refVal](#)

reweight

Reweight Abundance and Composition Data

Description

Weight the abundance data by adjusting survey and CPUE CVs, and weight the composition data by adjusting the effective sample size N .

Usage

```
reweight(obj, cvpro=FALSE, mean.age=TRUE, ...)
```

Arguments

obj	an AWATEA class object created initially by <code>readAD</code> .
cvpro	CV process error added to CV observation error: $c_t = \sqrt{c_o^2 + c_p^2}$; if FALSE index CVs are reweighted using the standard deviation of normalized residuals.

`mean.age` logical: if TRUE, use mean-age residuals to reweight the effective N for the age composition data (see Francis 2011);
 if FALSE, reweight N using $\Sigma(P(1 - P))/\Sigma(O - P)^2$, where O = observed proportions-at age and P = predicted/fitted proportions-at-age.

`...` additional arguments to `reweight`.

Details

For the reweight to work, a corresponding Awatea results file (`.res`) with the same prefix as the input file must be available in the working directory before calling `readAD`. This will populate the output slot with fitted data that the reweight needs.

Value

An `AWATEA` class object with the slots outlined in `readAD` with the following slot populated by this function:

`reweight`... list of reweight results:
`..nrwt`... the number of the current reweighting,
`..survey`... survey indices with CV values (observed, fitted, normalised residuals, reweighted),
`..cpue`... if used in the model, CPUE indices with CV values (as above),
`..wNcpa`... reweighted effective N for commercial compositions (proportions-at-age),
`..wNspa`... reweighted effective N for survey compositions,
`..SDNR`... standard deviation of normalised residuals for abundance and composition data,
`..wj`... weights for composition data from a mean-age weighted calculation (Francis 2011).

Author(s)

Rowan Haigh, Pacific Biological Station, Fisheries and Oceans Canada, Nanaimo BC.

References

Francis, R.I.C.C. (2011, in press) Data weighting in statistical fisheries stock assessment models. *Canadian Journal of Fisheries and Aquatic Sciences*.

[runADMB](#), [readAD](#), [stdRes.CA](#), [stdRes.index](#)

runADMB

Run AD Model Builder Code for Awatea

Description

Run compiled AD Model Builder code called `Awatea` to reconstruct a population trajectory for a marine fish stock.

Usage

```
runADMB(filename.ext, wd=getwd(), strSpp="YMR", runNo=25, rwtNo=0,
         doMPD=FALSE, N.reweight=0, cvpro=FALSE, mean.age=TRUE,
         doMCMC=FALSE, mcmc=1e+06, mcsave=1000, ADargs=NULL, verbose=FALSE,
         doMSY=FALSE, msyMaxIter=15000, msyTolConv=0.01,
         endStrat=0.301, stepStrat=0.001, ...)
```

Arguments

<code>filename.ext</code>	character file name including its extension.
<code>wd</code>	character string specifying the working directory, if different from the current working directory.
<code>strSpp</code>	string 3-letter code of the species.
<code>runNo</code>	the model run number.
<code>rwtNo</code>	the reweight number.
<code>doMPD</code>	logical: if TRUE, perform an MPD analysis.
<code>N.reweight</code>	the number of reweights to perform in the MPD analysis.
<code>cvpro</code>	CV process error added to CV observation error: $c_t = \sqrt{c_o^2 + c_p^2}$; if FALSE index CVs are reweighted using the standard deviation of normalized residuals.
<code>mean.age</code>	logical: if TRUE, use mean-age residuals to reweight the effective N for the age composition data (see Francis 2011); if FALSE, reweight N using $\Sigma(P(1 - P))/\Sigma(O - P)^2$, where O = observed proportions-at age and P = predicted/fitted proportions-at-age.
<code>doMCMC</code>	logical: if TRUE, perform an MCMC analysis.
<code>mcmc</code>	number of MCMC iterations to perform.
<code>mcsave</code>	frequency of MCMC iterations to save.
<code>ADargs</code>	additional arguments for a call to Awatea.
<code>verbose</code>	logical: if TRUE, spew Awatea messages to the R console.
<code>doMSY</code>	logical: if TRUE, perform an MSY analysis.
<code>msyMaxIter</code>	maximum iterations for the MSY calculations.
<code>msyTolConv</code>	tolerance for convergence in the MSY calculations.
<code>endStrat</code>	maximum fishing mortality for the MSY analysis.
<code>stepStrat</code>	fishing mortality step size for the MSY analysis.
<code>...</code>	additional arguments (not currently used for any purpose).

Details

This function is primarily used to automate MPD reweightings and to perform the MSY calculations. The MCMCs are better run from a command line console on a super computer as they generally require > 12 h to complete.

Note that once an MCMC has been created, the user can run various projections separately using `awatea -ind filename.ext -mceval` on the command line.

[importRes](#), [readAD](#), [reweight](#), [runSweave](#)

runMCMC

Wrapper to Function <runSweaveMCMC>

Description

This small utility function simply provides a wrapper to the function `runSweaveMCMC` so that multiple documents can be built at once.

Usage

```
runMCMC (runs=7, rewt=0:6, cpue=FALSE, estM=TRUE)
```

Arguments

<code>runs</code>	the run number(s).
<code>rewts</code>	the reweight number(s).
<code>cpue</code>	logical: if TRUE, retain the CPUE figures in the Sweave file.
<code>estM</code>	logical: if TRUE the routine will assume natural mortality M was estimated in the run, and the Sweave code uses the parameters "M_1" and "M_2"; if FALSE, the function removes these parameters from the Sweave file.

Details

Essentially loops through `runSweaveMCMC` using `(i in runs)` and `(j in rewt)`.

Value

Produces multiple Sweave documents and PDF files for MCMCs.

Note

Seave files can be found in the library directory:

```
.../R/.../library/PBSawatea/snw/ymrrun-masterMCMC.Snw
```

```
.../R/.../library/PBSawatea/snw/ymrrun-masterMCMC20yrProjs.Snw
```

Author(s)

[runSweaveMCMC](#), [runSweave](#), [runMPD](#)

runMPD

Wrapper to Function <runSweave>

Description

This small utility function simply provides a wrapper to the function `runSweave` so that multiple documents can be built at once.

Usage

```
runMPD(runs=1, rewt=0:6, cpue=FALSE)
```

Arguments

<code>runs</code>	the run number(s).
<code>rewt</code>	the reweight number(s).
<code>cpue</code>	logical: if TRUE, retain the CPUE figures in the Sweave file.

Details

Essentially loops through `runSweave` using `(i in runs)` and `(j in rewt)`.

Value

Produces multiple Sweave documents and PDF files.

Note

A recent Seave file called `ymrrun-master.Snw` can be found in the library directory:

```
.../R/.../library/PBSawatea/snw
```

Author(s)

Rowan Haigh, Pacific Biological Station, Fisheries and Oceans Canada, Nanaimo BC

See Also

[runSweave](#), [runSweaveMCMC](#), [runMCMC](#)

runSweave

Run Customised Sweave Files for Awatea MPD Runs

Description

Create and run customised Sweave files for Awatea MPD runs.

Usage

```
runSweave(wd=getwd(), cpue=FALSE, strSpp="YMR",
          filename="input25-ymr.txt", runNo=25, rwtNo=0,
          running.awatea=0, Nsurvey=5)
```

Arguments

wd	working directory in which Awatea input and master Sweave files occur.
cpue	logical: if TRUE the routine will leave calls to CPUE figures in the Sweave file, otherwise, they are removed.
strSpp	three-letter code that identifies the species.
filename	name of Awatea input file.
runNo	the run number that identifies a unique combination of input values.
rwtNo	the reweight number of the MPD run to build and collate figures.
running.awatea	numeric: if 0 load a previous .rep file, if 1 re-run Awatea
Nsurvey	number of surveys specified in the input file; controls image creation and placeholders.

Details

The values specified by the arguments (or derived variables) are directly substituted into the Sweave file wherever similarly named variables preceded by the @ symbol occur.

The cpue switch signals the removal of pieces of Sweave code if cpue=TRUE.

The Nsurvey argument essentially copies one Sweave line into Nsurvey lines for a set of lines identified by unique Sweave snippets.

Value

A customised Sweave file for `runNo` and `rwtNo` is created in a subdirectory `./strSpprun/MPD.runNo.rwtNo` from where it is run.

Note

A fairly recent Seave file called `ymrrun-master.Snw` can be found in the library directory: `.../R/.../library/PBSawatea/snw`

Author(s)

Rowan Haigh, Pacific Biological Station, Fisheries and Oceans Canada, Nanaimo BC

runSweaveMCMC

Run Customised Sweave Files for Awatea MCMC Runs

Description

Create and run customised Sweave files for Awatea MCMC runs.

Usage

```
runSweaveMCMC( wd=getwd(), cpue=FALSE, estM=TRUE,
               strSpp="YMR", filename="input25-ymr.txt",
               runNo=25, rwtNo=0, running.awatea=0 )
```

Arguments

<code>wd</code>	working directory in which Awatea input and master Sweave files occur.
<code>cpue</code>	logical: if <code>TRUE</code> the routine will leave calls to CPUE figures in the Sweave file, otherwise, they are removed.
<code>estM</code>	logical: if <code>TRUE</code> the routine will assume natural mortality M was estimated in the run, and the Sweave code uses the parameters " <code>M_1</code> " and " <code>M_2</code> "; if <code>FALSE</code> , the function removes these parameters from the Sweave file.
<code>strSpp</code>	three-letter code that identifies the species.
<code>filename</code>	name of Awatea input file.
<code>runNo</code>	the run number that identifies a unique combination of input values.
<code>rwtNo</code>	the reweight number of the MPD run to build and collate figures.
<code>running.awatea</code>	numeric: if 0 load a previous <code>.rep</code> file, if 1 re-run Awatea

Details

The values specified by the arguments (or derived variables) are directly substituted into the Sweave file wherever similarly named variables preceded by the @ symbol occur.

The `cpue` switch signals the removal of pieces of Sweave code if `cpue=TRUE`.

The `estM` switch signals the removal of "M_1 " and "M_2 " from the Sweave code if `estM=FALSE`.

Value

A customised Sweave file for `runNo` and `rwtNo` is created in a subdirectory

`./strSpprun/MCMC.runNo.rwtNo`

from where it is run.

Note

Sweave files can be found in the library directory:

`.../R/.../library/PBSawatea/snw/ymrrun-masterMCMC.Snw`

`.../R/.../library/PBSawatea/snw/ymrrun-masterMCMC20yrProjs.Snw`

Stock Recruitment Function

Description

Take a vector of spawners in year $t-1$ and calculate recruits in year t .

Usage

```
srFun(spawners, h = h.mpd, R0 = R0.mpd, B0 = B0.mpd)
```

Arguments

<code>spawners</code>	a vector of spawners where either : each element corresponds to spawners in year $t-1$ or the vector calculates a single year but multiple MCMCs.
<code>h</code>	steepness parameter value.
<code>R0</code>	recruitment at $t = 0$ (virgin conditions).
<code>B0</code>	spawning biomass at virgin conditions.

Details

(AME wording) To input a vector of spawners in year $t-1$ and calculate recruits in year t . Output for recruits is vector, each element corresponds to spawners the the year before, so will usually want to shift the output by 1 so that recruits in year t are based on spawners in year $t-1$.

Can also have each input as a vector (used when calculating a single year but multiple MCMCs, as in first year of projections is based on penultimate year of MCMC calculations).

Value

A vector of recruitments in year t .

Note

This function was originally a subfunction in `plt.mpdGraphs`.

`stdRes.CA`

Calculate Standardised Residuals for Robust Normal Likelihood

Description

Calculate the standardised residuals for Awatea's implementation of the Fournier *robustified* normal likelihood for proportions-at-length.

Based on PJS's summary of the CASAL document and ACH's change to length.

Usage

```
stdRes.CA(obj, trunc=3, myLab="Age Residuals", prt=TRUE)
```

Arguments

<code>obj</code>	scape/list object of Awatea's results file (<code>.res</code>).
<code>trunc</code>	maximum standardised residual; values greater than this are set to <code>trunc</code> .
<code>myLab</code>	general label for the output.
<code>prt</code>	logical: if <code>TRUE</code> , print the results.

Value

List object of standardised residuals.

Author(s)

Andrew Edwards, Pacific Biological Station, Fisheries and Oceans Canada, Nanaimo BC

stdRes.index

Calculate Standardised Residuals for Abundance Indices

Description

Calculate the standardised residuals for commercial and survey indices.

Usage

```
stdRes.index(obj, label=NULL, prt=TRUE)
```

Arguments

obj	data frame of observed and fitted index values from Awatea's results file (.res).
label	general label for the output.
prt	logical: if TRUE, print the results.

Value

Input data frame with additional column of standardised residuals.
